

AMENDMENTS TO THE SPECIFICATION

Please replace the paragraph beginning at page 17, line 6, and ending at page 17, line 25, with the following amended paragraph.

-- In general, the layout language for a Web site and/or document is HTML (hypertext markup language); although other markup languages such as, e.g., XML (extensible markup language) or WML (wireless markup language) may be utilized in developing Web sites and their associated documents. Web sites and the related documents are stored in HTML format in association with "server" software on remote servers. A Web site and/or documents are given URLs (uniform resource locators) which are essentially address paths identifying the server which hosts the particular Web site and/or related documents plus the location of the site and documents on the server. Using "browser" software, an end-user (client/subject) can send a request from a client/subject computer to access a Web site or an individual document within the Web site stored at a particular URL. Browser software such as NETSCAPE™ NAVIGATOR™ ~~Netscape™ Navigator~~, of Netscape Communications Corporation of Mountain View, California, is well known and widely available. When the server receives the client/subject's request, it sends the requested HTML Web site or document to the client where the Web site and/or document can be displayed. The communication protocol used in making such a request and in transferring Web documents is "Hypertext Transfer Protocol" (HTTP).--
